

# LOW-VOLTAGE 10-BIT BUS SWITCH WITH ACTIVE HIGH AND LOW ENABLES

**IDT74CBTLV3862**

## FEATURES:

- 5Ω A/B bi-directional switch
- Isolation Under Power-Off Conditions
- Over-voltage tolerant
- Latch-up performance exceeds 100mA
- V<sub>CC</sub> = 2.3V - 3.6V, normal range
- ESD >2000V per MIL-STD-883, Method 3015; >200V using machine model (C = 200pF, R = 0)
- Available in SSOP, QSOP, and TSSOP packages

## APPLICATIONS:

- 3.3V High Speed Bus Switching and Bus Isolation

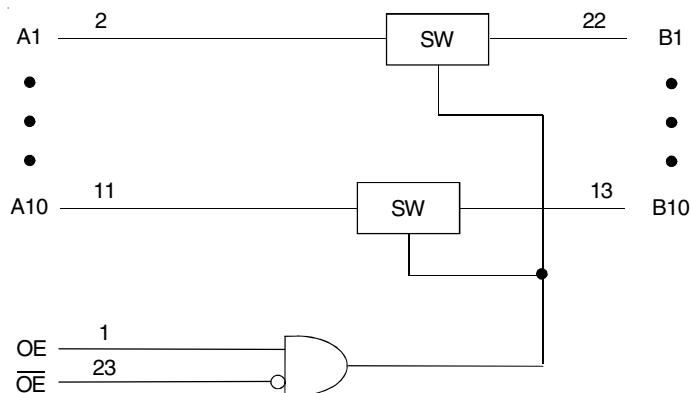

## DESCRIPTION:

The CBTLV3862 provides ten bits of high-speed bus switching with low on-state resistance of the switch allowing connections to be made with minimal propagation delay.

The device is organized as one 10-bit bus switch. The switches are controlled by independent active-low enable ( $\overline{OE}$ ) and active-high enable (OE) controls.

To ensure the high-impedance state during power up or power down,  $\overline{OE}$  should be tied to V<sub>CC</sub> through a pullup resistor; the minimum value of the resistor is determined by the current-sinking capability of the driver, and OE should be tied to GND.

### NOTES:

1. Typical Values are at V<sub>CC</sub> = 3.3V, +25°C ambient.
2. The increase in supply current is attributable to each input that is at the specified voltage level rather than V<sub>CC</sub> or GND.
3. This is measured by the voltage drop between the A and B terminals at the indicated current through the switch.
