

Features

- 24 GHz K-band miniature transceiver
- 180MHz sweep FM input
- Dual 4 patch antenna
- Single balanced mixer with 50MHz bandwidth
- Beam aperture 80°/34°
- 15dBm EIRP output power
- 25x25mm² surface, 6mm thickness
- Lowcost design
- 100% electrically compatible with K-LC1

K-LC1a Actual Size

Applications

- General purpose movement detectors
- Security systems
- Object speed measurement systems
- Simple shorrange ranging detection
- Highspeed shorrange data transmission
- Industrial sensors

Description

K-LC1a is a 8 patch Doppler module with an asymmetrical beam for lowcost short distance applications. Its typical applications are movement sensors in the security and automatic door domain. In building automation this module may be an alternative for infrared PIR or AIR systems thanks to its outstanding performance/cost ratio. The module is extremely small and lightweight.

With its IF bandwidth from DC to 50MHz it opens many new applications.

FM and FSK are possible thanks to the unique RFbeam oscillator design. This allows to use this lowcost module even in ranging applications.

A powerful starterkit with signal conditioning and visualization is available from RFbeam. Find more informations at www.rfbeam.ch.

Note 1 The VCO input has an internal voltage source with approx. 0.9VDC. For driving this pin it is necessary to source and sink current

Note 2 Transmit frequency stays within 24.050 to 24.250GHz over the specified temperature range when the VCO pin is left open

Note 3 Theoretical value, given by Design

Antenna System Diagram

This diagram shows module sensitivity in both azimuth and elevation directions. It incorporates therefore the transmitter and receiver antenna characteristics.

FM Characteristics

VCO Voltage generates an output signal even without an object in range because of the finite isolation between transmitter and receiver path. This effect is called self-mixing and leads to a DC signal that depends on the carrier frequency / the VCO voltage.

Application Notes

Sensitivity and Maximum Range

The values indicated here are intended to give you a 'feeling' of the attainable detection range with this module. It is not possible to define an exact RCS (radar cross section) value of real objects because reflectivity depends on many parameters. The RCS variations however influence the maximum range only by $\sqrt[4]{\sigma}$.

Maximum range for Doppler movement depends mainly on:

- Module sensitivity	S:	-114dBc (@0.5kHz IF Bandwidth)
- Carrier frequency	f ₀ :	24.125GHz
- Radar cross section RCS ("reflectivity") of the object	σ ¹⁾ :	1m ² approx. for a moving person >50m ² for a moving car

note ¹⁾ RCS indications are very inaccurate and may vary by factors of 10 and more.

The famous "Radar Equation" may be reduced for our K-band module to the following relation:

$$r = 0.0167 \cdot 10^{\frac{-s}{40}} \cdot \sqrt[4]{\sigma}$$

Using this formula, you get an indicative detection range of

- 12 meters for a moving person.
- > 31 meters for a moving car

Please note, that range values also highly depend on the performance of signal processing, environment conditions (i.e. rain, fog), housing of the module and other factors.

For simple detection purposes (security applications e.g.) without the need of speed measurements, range may be enhanced by further reducing the IF bandwidth. With 250Hz bandwidth and a simple comparator, we get already a 25m detection range.
