### DESCRIPTION

NEC's UPC2756TB is a silicon MMIC integrated circuit manufactured using the NESAT III process. The device consists of a double balance mixer, an IF amplifier and a built-in LO. This device is suitable as a L-BAND downconverter for the receiver stage of wireless systems. The UPC2756TB is pin compatible and has comparable performance as the larger UPC2756T, so it is suitable for use as a replacement to help reduce system size. The IC housed in a 6 pin super minimold or SOT-363 package.

NEC's stringent quality assurance and test procedures ensure the highest reliability and performance.

**PIN FUNCTIONS**

Pin No.	Symbol	Applied Voltage (V)	Pin Voltage (V)	Description	Internal Equivalent Circuit
1	RFIN	–	1.2	Signal input pin to double balanced mixer. This pin must be coupled to the signal source with a blocking capacitor.	
2	GND	0	–	Ground pin. This pin should be connected to system ground with minimum inductance. Ground pattern on the board should be formed as wide as possible.	
3	LO1	–	1.2	These pins are both the base-collectors of a differential amplifier configured to oscillate when equipped with an external tank resonator circuit. Each pin must be coupled to the tank circuit with a blocking capacitor. In the case of an external LO source, bypass the unused pin with a capacitor to ground.	
4	LO2	–	1.2		
5	VCC	2.7 to 3.3	–	Power supply pin. This pin should be externally equipped with a bypass capacitor to minimize ground impedance.	
6	IFOUT	–	1.7	Output of single-ended push-pull IF buffer amplifier. This is an emitter-follower output with low impedance. This pin must be coupled to the next stage with a blocking capacitor.
