

100336 Low Power 4-Stage Counter/Shift Register

General Description

The 100336 operates as either a modulo-16 up/down counter or as a 4-bit bidirectional shift register. Three Select (S_n) inputs determine the mode of operation, as shown in the Function Select table. Two Count Enable (\overline{CEP} , \overline{CET}) inputs are provided for ease of cascading in multistage counters. One Count Enable (\overline{CET}) input also doubles as a Serial Data (D_0) input for shift-up operation. For shift-down operation, D_3 is the Serial Data input. In counting operations the Terminal Count (\overline{TC}) output goes LOW when the counter reaches 15 in the count/up mode or 0 (zero) in the count/down mode. In the shift modes, the \overline{TC} output repeats the Q_3 output. The dual nature of this \overline{TC}/Q_3 output and the D_0/\overline{CET} input means that one interconnection from one stage to the next higher stage serves as the link for multistage counting or shift-up operation. The individual Preset (P_n) inputs are used

to enter data in parallel or to preset the counter in programmable counter applications. A HIGH signal on the Master Reset (\overline{MR}) input overrides all other inputs and asynchronously clears the flip-flops. In addition, a synchronous clear is provided, as well as a complement function which synchronously inverts the contents of the flip-flops. All inputs have 50 k Ω pull-down resistors.

Features

- 40% power reduction of the 100136
- 2000V ESD protection
- Pin/function compatible with 100136
- Voltage compensated operating range = -4.2V to -5.7V
- Available to industrial grade temperature range
- Available to MIL-STD-883

Absolute Maximum Ratings (Note 2)

Storage Temperature (T_{STG})	-65°C to +150°C
Maximum Junction Temperature (T_J)	
Ceramic	+175°C
Plastic	+150°C
V_{EE} Pin Potential to Ground Pin	-7.0V to +0.5V
Input Voltage (DC)	V_{EE} to +0.5V
Output Current (DC Output HIGH)	-50 mA
ESD (Note 3)	$\geq 2000V$

Recommended Operating Conditions

Case Temperature (T_C)	
Commercial	0°C to +85°C
Industrial	-40°C to +85°C
Military	-55°C to +125°C
Supply Voltage (V_{EE})	-5.7V to -4.2V

Note 2: Absolute maximum ratings are those values beyond which the device may be damaged or have its useful life impaired. Functional operation under these conditions is not implied.

Note 3: ESD testing conforms to MIL-STD-883, Method 3015.

Note 6: Output-to-Output Skew is defined as the absolute value of the difference between the actual propagation delay for any outputs within the same packaged device. The specifications apply to any outputs switching in the same direction either HIGH to LOW (t_{OSHL}), or LOW to HIGH (t_{OSLH}), or in opposite directions both HL and LH (t_{OST}). Parameters t_{OST} and t_{ps} guaranteed by design

Note 7: The propagation delay specified is for single output switching. Delays may vary up to 250 ps with multiple outputs switching.

Note 10: F100K 300 Series cold temperature testing is performed by temperature soaking (to guarantee junction temperature equals $-55^{\circ}C$), then testing immediately without allowing for the junction temperature to stabilize due to heat dissipation after power-up. This provides "cold start" specs which can be considered a worst case condition at cold temperatures.

Note 11: Screen tested 100% on each device at $-55^{\circ}C$, $+25^{\circ}C$, and $+125^{\circ}C$, Subgroups 1, 2, 3, 7, and 8.

Note 12: Sample tested (Method 5005, Table I) on each manufactured lot at $-55^{\circ}C$, $+25^{\circ}C$, $+125^{\circ}C$, Subgroups A1, 2, 3, 7, and 8.

Note 13: Guaranteed by applying specified input condition and testing V_{OH}/V_{OL} .

Note 14: F100K 300 Series cold temperature testing is performed by temperature soaking (to guarantee junction temperature equals -55°C), then testing immediately after power-up. This provides "cold start" specs which can be considered a worst case condition at cold temperatures.

Note 15: Screen tested 100% on each device at +25°C temperature only, Subgroups A9.

Note 16: Sample tested (Method 5005, Table I) on each manufactured lot at +25°C, Subgroups A9, and at +125°C and -55°C temperatures, Subgroups A10 and A11.

Note 17: Not tested at +25°C, +125°C, and -55°C temperature (design characterization data).

Note 18: The propagation delay specified is for single output switching. Delays may vary up to 250 ps with multiple outputs switching.

Notes:

V_{CC} , $V_{CCA} = +2V$, $V_{EE} = -2.5V$
 $L1$, $L2$ and $L3 =$ equal length 50Ω impedance lines
 $R_T = 50\Omega$ terminator internal to scope
 Decoupling $0.1 \mu F$ from GND to V_{CC} and V_{EE}
 All unused outputs are loaded with 50Ω to GND
 $C_L =$ Fixture and stray capacitance $\leq 3 pF$
 Pin numbers shown are for flatpak;
 for DIP see logic symbol

Notes:

For shift right mode, +1.05V is applied at S_0 .
The feedback path from output to input should be as short as possible.

Notes:

t_s is the minimum time before the transition of the clock that information must be present at the data input.
 t_h is the minimum time after the transition of the clock that information must remain unchanged at the data input.

LIFE SUPPORT POLICY

FAIRCHILD'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT OF FAIRCHILD SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and (c) whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component in any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
